Research

Funding for climate change study

SACKVILLE – Mount Allison geography professor Colin Laroque has received funding to pursue two major research projects as part of International Polar Year, an intensive research program in the polar regions. The research is expected to take place over the next 24 months and involve researchers from more than 60 countries. Laroque's projects will examine the effects of climate change in the Canadian Arctic upon tundra and tree ecosystems. Both projects will be conducted in Labrador.
